What are the components of a battery management system (BMS)?

A typical BMS consists of: Battery Management Controller (BMC): The brain of the BMS, processing real-time data. Voltage and Current Sensors: Measures cell voltage and current. Temperature Sensors: Monitor heat variations. Balancing Circuit: Ensures uniform charge distribution. Power Supply Unit: Provides energy to the BMS components.

How does BMS calculate battery capacity?

The BMS calculates key battery metrics: State of Charge (SoC): The available battery capacity compared to its full capacity. State of Health (SoH): The overall health and aging status of the battery. Depth of Discharge (DoD): The percentage of battery capacity used during a discharge cycle. 05. Thermal Management

Can a BMS be used as a stand-alone device?

In the case of electric or hybrid vehicles, the BMS is only a subsystem and cannot work as a stand-alone device. It must communicate with at least a charger (or charging infrastructure), a load, thermal management and emergency shutdown subsystems.

How much does a BMS cost?

Consumer electronics BMS only costs a few dollars, while automotive grade BMS costs hundreds of dollars. Minimalist design (such as a smartphone BMS with only one chip), relying on voltage lookup table method to estimate power consumption. Intelligence: AI algorithms replace traditional models (such as Tesla's BMS neural network).
