On the summer solstice, you'll cast the shortest shadow of the year due to the sun's tilt. When summer starts in the Northern Hemisphere, it's the beginning of winter in the ...

The summer solstice occurs during the hemisphere's summer. In the Northern Hemisphere, this is the June solstice (20 or 21 June) and in the ...

As a result, the Northern Hemisphere gets the most Sun (and experiences its longest days) in the months of June, July and August, which we call "summer". At the same ...

Summer begins in the Northern Hemisphere on Friday, June 20, at 10:42 p.m. Eastern Daylight Time. This annual event, known as the June solstice, marks a specific point ...

The Sun appears higher in the sky during the northern hemisphere summer, moving lower as we move into winter. The larger loop shows how the ...

May, June and July are the months when the Northern Hemisphere receives the most sunlight due to the Earth's tilt on its axis. Because of this, the three-month period is ...

May, June and July are the months when the Northern Hemisphere receives the most sunlight due to the Earth's tilt on its axis. ...

At solar noon, the gnomon stone near the center of the calendar circle casts a shadow due north. That shadow is longest on the winter solstice and ...

At solar noon, the gnomon stone near the center of the calendar circle casts a shadow due north. That shadow is longest on the winter solstice and shortest on the summer solstice.

For scientists, the solstice is a key marker in Earth's orbit around the Sun. It helps us understand axial tilt, seasonal change, and the ways solar energy shapes our climate and ...

Earth has four seasons, but do other planets in our solar system also have hot summer days and cold winter nights?

These resource packages are suitable for educators, students, and anyone interested in learning more about our solar system. They are updated as mission milestones ...

The Sun appears higher in the sky during the northern hemisphere summer, moving lower as we move into winter. The larger loop shows how the Sun's position changes rapidly between ...

As a result, the Northern Hemisphere gets the most Sun (and experiences its longest days) in the months of June, July and August, ...

The summer solstice occurs during the hemisphere's summer. In the Northern Hemisphere, this is the June solstice (20 or 21 June) and in the Southern Hemisphere, this is the December ...

For scientists, the solstice is a key marker in Earth's orbit around the Sun. It helps us understand axial tilt, seasonal change, and ...
